```

```
-----
```

アノマリー検出レイヤー。v2の改善点:

【インフレ対策】

- 動的ベースライン: スコアを「現世代の集団中央値」からの相対値として計算する。
全員が同じ方向に進化しても、集団内の相対的な逸脱だけをアノマリーと見なす。
→ 全員がアノマリーになることを構造的に防ぐ。
- 第二の正常 (new normal) の検出: 過去N世代のスコア分布を追跡し、
「以前のアノマリーが今の正常になった」かどうかを記録する。

軸1: 語彙乖離 - TF-IDFベクトルのコサイン距離 (動的ベースライン補正付き)

軸2: 構造乖離 - 文長・句読点・繰り返しの統計的逸脱

軸3: 新語スコア - 直近世代の集団語彙に存在しない語の割合

スコアは [0, 1]。ただし集団の中央値が常に ~0.5 に正規化されるため、

「全員がアノマリー」という状態は原理的に発生しない。
